F;465-1315/Domain: ganglioside binding (fragment C) #status predicted <TXC>
F;233,237/Binding site: zinc (His) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      C; Function:
A; Description: blocks neuroexocytosis via hydrolysis of a Gln-Phe peptide bond in C; Superfamily: tetanus toxin C; Superfamily: tetanus toxin C; Keywords: hydrolase; metalloproteinase; neurotoxin; transmembrane protein; zinc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C;Comment: The source of this protein was an extrachromosomal plasmid. C;Comment: The precursor is cleaved by endogenous proteinase activity to form light (fradual chains are not toxic when separated). The amino end of the heavy chain (fragment B) C;Comment: Fragment B forms ion channels in a lipid bilayer. Fragment C binds to ganglid C;Comment: This potent neurotoxin binds to peripheral neuronal synapses, is internalized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A;Title: Structural studies A;Reference number: S69348; A;Accession: S69348

C; Genetics:
A; Introns: 45/3; 77/3
C; Function: gonadoliberin stimulates pituitary secretion of lut
A; Note: gonadoliberin-associated protein may have prolactin releas
C; Superfamily: gonadoliberin
C; Keywords: amidated carboxyl end; hormone; hypothalamus; pyroglut
F; 1-23/Domain: signal sequence #status predicted <SIG>F; 22-31/Product: gonadoliberin #status predicted <GIB>F; 35-90/Product: gonadoliberin #status predicted (Gln) (in mature:

gonadoliberin precursor [validated] - human
y,Alternate names: gonadotropin releasing hormone (GnRH); luteinizing hormone
N;Contains: gonadoliberin-associated protein (GAP); progonadoliberin
C;Species: Homo sapiens (man)
C;Date: 17-Mar-1987 #sequence_revision 21-Jul-1995 #text_change 08-Dec-2000
C;Date: 17-Mar-1987 #sequence_revision 21-Jul-1995 #text_change 08-Dec-2000
C;Accession: S05308; A26173; A9342; A90108; A01410; S45718

gonadoliberin precursor - African clawed frog
N;Alternate names: luteinizing hormone releasing hormone
C;Species: Xenopus laevis (African clawed frog)
C;Date: 13-Sep-1996 #sequence_revision 13-Sep-1996 #text_chang
C;Accession: I51423
C;Accession: Wray, S.; Battey, J.F.
Endocrinology 134, 1835-1845, 1994
A;Title: The frog GnRH-I gene has a mammalian-like expression
A;Reference number: I51423; MUID:94185563; PMID:8137750

Struct. Biol. 4:788-792(1997).

FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYMAPSES, IS INTERNALIZED AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC ENDOPERTIDASE THAT CAPALYZES THE HYDROLYSIS OF THE 76-GLN-[-PHE-77]
                                                                                                                                                                                                                                                                                                                                                                         GANGLIOSIDE RECEPTORS.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY M27.
                                                                                                                                                                                                                                                                                                                                                                                                                     SYNAPCOBREVID 2.

COFACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED T
